

Video Playout Software

Software Applications

The Airbox software application, combined with XT series servers, offers cost-effective multichannel playout with intuitive and user-friendly controls. It controls both ingest and playout, driven by simple built-in automation, complete with scheduling and playlist management. EVS Airbox, combined with networked XT series servers, is the perfect turnkey system for use in both TV production or in traditional TV playout applications.

The dedicated EVS AirBox hardware and software package has been field-proven for reliability in 24/7 mission-critical operations, with support for SD and HD as well as full integration with all the elements that are part of today's workflows.

Airbox gives the complete set of tools you need for fast-paced live news and sports production, is ideal for non-stop unattended broadcasting, and is the ultimate Betacart replacement to enable you to launch new HD channels at a minimum cost.

Key Features

- Complete and reliable control of ingest and playout
- Efficient playlist management tool
- Comprehensive asset management
- The full power of networking
- Easy workflow integration

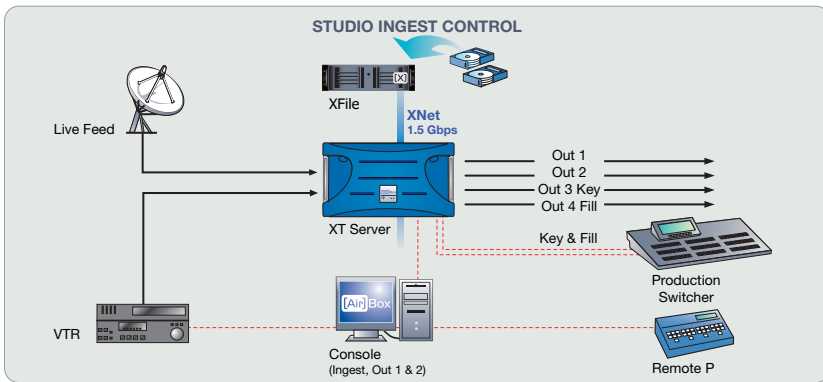

Straightforward Content Management

Complete and reliable control of ingest and playback

Airbox provides intuitive and flexible control over the ingest and playback of XT series servers without extra cost and complexity.

- Loop recording ensures continuous capture of content

- Frame-accurate ingest from tape with VTR control
- Playback of material as it is, or in a playlist
- Able to control playback for multiple sets of channels simultaneously

Efficient playlist management tool

Airbox features advanced functions, typical of bigger automation systems within an intuitive Windows-based interface.

- Straightforward 'drag & drop' commands to build playlists
- Select, cue and play sequences in an unattended loop mode from up to 4 pre-loaded channels
- Playlists may include mix & wipe effect, 'live' and 'VTR' inserts
- Clips in playlists can be easily updated or edited without interrupting the ongoing playback

Comprehensive asset management

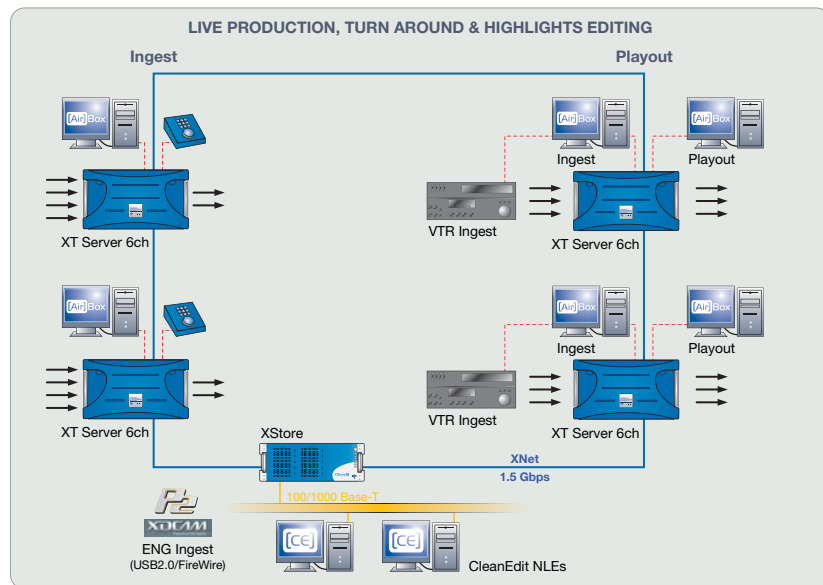

Content can be managed in different ways to fit with various workflows

- Powerful SQL database
- Frame-accurate ingest from tape with VTR control
- Assign different media categories, keywords and ratings to each clip
- Sort functions and filters to find specific shots
- Post-produced content is directly available for playback

The full power of networking

Airbox gives you a perfect overview of all media available over the XNet

- Real-time access to any content stored on XT series servers
- Instant preview and playback of any material even while recording
- Scalable storage via multiple XT servers and XFile & Xstore on/near-line storage

Easy workflow integration

Fast and reliable integration with your existing installation

- 'Plug & Play' compatibility

- Easy integration into any infrastructure
- Open to third party / overall station automation
